

BUGGING TOPICS:

Bugging score :

This score gives an estimate of how much a topic entered by the user could be annoying.

F (Favourite count):

The number of questions with the favourite count less than certain threshold (h) by the total number of questions related to the user's query. h can be defined by the user.

$$F \leq 1$$

L (Life time of question):

The number of questions with unaccepted answers and also with the difference in timestamp of the last activity and creation exceeding the limit set by the user normalized by the total number of questions related to the topic.

$$L \leq 1$$

C(Comment count):

The number of questions with unaccepted answers and also with the number of negative comments more than user defined count by the total number of questions related to the topic.

$$C \leq 1$$

V(Votes):

For each question related to the user's query, find the average of all the answer votes [total number of upvotes for each answer/total number of answers]. Then the number of questions with the average answer vote less than a user defined threshold by the total number of questions gives an estimate of how hard it is to get useful hints on the topic.

$$V \leq 1$$

$$\textbf{Score} = F + L + C + V$$
